

Instructions for Changing Under Sink - Quick-Change Omnipure Filters

1. Turn off your tap under the sink where the Water Filter(s) are connected to it.
2. Unscrew both of the old filters (anti-clockwise)
3. Pull out the yellow tab at the top of new filters
4. Screw in the Sediment filter (Q5505-60) in the first position – this is the 1st Filter that the water supply feeds into
5. Screw in the Carbon filter (Q5540-60) in the second position
6. Once in position, turn the tap on and let the water run for a few minutes until clear.
7. There will be some carbon dust (black colour) from the Carbon Cartridge flushing through which is to be expected.
8. Once the water is clear, you can use the filtered water.
9. Once the Tap is running, check for leaks....

Every now and then there can be a small leak from the Filter Head Assembly to the Filter, this can be caused by a small dirt particle or the O ring being compressed from having the previous filter inserted for a period of time.

10. Take the Filter off (screw out) – and clean the Filter Head assembly with a brush and then re-connect the Filter – you may need to re-connect the Filter a few times to ensure O ring is clear of any small particles.
